Khorramshahr-4 Missile Latest News

Iran recently released dramatic footage of its Khorramshahr-4 ballistic missile — one of Tehran's most powerful medium-range missiles — as tensions with the United States continue to rise.

About Khorramshahr-4 Missile

- Also known as the **Kheibar missile**, it is a **medium-range ballistic missile developed by Iranian state-owned defence company Aerospace Industries Organization (AIO)**.
- **Iran** first test-fired the missile in January 2017 and first publicly displayed it at a September 2017 military parade in Tehran.

Khorramshahr-4 Missile Features

- It stands 13 metres tall along with a 1.5-metre diameter weighing up to 20 tonnes.
- It is **liquid-fuelled** and has an operational **range** of approximately **2,000 kilometers**.
- It has the capability of carrying **multiple warheads** of up to 1,800 kg.

- It is capable of striking 80 targets upon reaching the target area.
- Its **launch preparation time** is **less than 15 minutes**.
- The missile travels **16 times the speed of sound in the outer atmosphere** and eight times within the atmosphere.
